

mri ruby is dynamically types but to use static version we can use sorbet/rbs?

Yes, that is completely correct. MRI (Matz's Ruby Interpreter) remains fundamentally a dynamically typed language, but **you can achieve gradual static type checking by choosing between Sorbet or RBS**. [DEV Community +4](#)

However, they tackle the problem in fundamentally different ways. Here is a breakdown of how they compare:

Feature 🔗	Sorbet (by Stripe)	RBS (Ruby Core Standard)
Type Location	Inline code (using <code>sig</code> blocks)	Separate signature files (<code>.rbs</code>)
Execution	Performs both static and runtime checks	Purely static; no native runtime execution checks
Type Checker	Uses the <code>sorbet</code> static analysis engine	Requires an external checker like <code>Steep</code>
Syntax Style	Ruby-based DSL	Custom signature language (like TypeScript <code>.d.ts</code>)

🔥 Option 1: Sorbet

[Sorbet](#) introduces inline type declarations directly into your Ruby codebase. [YouTube · Ruby Central +1](#)

- **The Code Style:** You write code using a Ruby DSL. [YouTube · RubyKaigi](#)

```
ruby

# typed: true
extend T::Sig

sig { params(name: String).returns(String) }
def greet(name)
  "Hello, #{name}!"
end
```

Use code with caution. [🔗](#)

- **Pros:**
 - Types and code live in the exact same file, making it easy to read.
 - It will actively raise an exception at runtime if a type constraint is broken.
 - It features incredibly fast static parsing and linting speeds. [DEV Community +4](#)

💧 Option 2: RBS

RBS is the official type specification system shipped natively starting with Ruby 3.0. [AppSignal Blog +2](#)

- **The Code Style:** Your core file `user.rb` remains pristine, dynamic Ruby code. You store your types in a parallel file called `user.rbs` : [Rails at Scale](#)

```
rbs

# user.rbs
class User
  def greet: (String name) -> String
end
```

Use code with caution. [🔗](#)

- **Pros:**
 - Zero clutter in your actual runtime Ruby application files.
 - Officially supported by the core Ruby team.
 - Perfect for typing legacy or open-source gems without changing source logic. [YouTube · Ruby Central +4](#)

Note: Since RBS is just a signature layout language, you must install a separate third-party type checker such as [Steep](#) to actually scan and flag errors in your code base. [YouTube · Ruby Central +1](#)

🍷 The Modern State: Convergence

You no longer have to fully pick one over the other. The Ruby ecosystem has evolved to allow interoperability. For instance, modern tooling allows **inline RBS comments**, allowing you to write RBS types right inside your Ruby file comments while utilizing Sorbet as your static engine tool underneath. [YouTube · Ruby Central +3](#)

If you are setting up type-checking for a project, tell me:

- Are you working on a **brand new greenfield app** or an **existing legacy codebase**?
- Are you using **Ruby on Rails** or plain Ruby?

I can provide the exact terminal commands and configuration files to get your environment up and running.

[🔗](#) [↩](#) [🔖](#) [💬](#) [⋮](#)

I am currently learning ruby but most probabaly will go to ruby on rails after learing this. Does ROR by default uses ... [▼](#)

No, Ruby on Rails (Rails) does not use static typing by default. [🔗](#)

Rails embraces Ruby's native dynamic typing, relying on duck typing and runtime flexibility rather than compilation checks. [🔗](#)

🌱 Why Rails Defaults to Dynamic Typing

- **Metaprogramming reliance:** Rails heavily generates methods at runtime. For example, when you connect to a database, Rails looks at your database columns and dynamically creates methods like `user.email` or `user.saved?`. Static type checkers struggle heavily with this "magic." [🔗](#)
- **The "Rails Way" philosophy:** Rails prioritizes developer speed, readability, and convention over configuration. Static typing requires extra configuration that goes against this philosophy. [🔗](#)

🔧 How to Use Static Typing in Rails

While it is not the default, you can absolutely add static typing to a Rails project. Because of Rails' dynamic nature, **Sorbet** is the industry-standard choice here because of a specific tool called `sorbet-rails`. [🔗](#)

1. Sorbet + sorbet-rails (Recommended)

The community created a gem called `sorbet-rails`. It scans your database schema and automatically generates the static type definitions for all your dynamic Rails methods. [🔗](#)

- It makes your dynamic ActiveRecord models understandable by the static compiler.
- It is used heavily in production by massive companies like Stripe and Shopify. [🔗](#)

2. RBS + Steep

You can use the official Ruby RBS system, but you will need to rely on gems like `rbs_rails` to generate the `.rbs` files for your database models. This setup is currently less common in the industry than Sorbet for Rails applications. [🔗](#)

💡 Advice for Your Learning Journey

Since you are currently learning Ruby and planning to move to Rails, **do not worry about static typing right now**.

Learn standard, dynamic Ruby first. Understand how Rails works out of the box. Once you are comfortable building a basic Rails application, you can experiment with adding Sorbet to see how it catches bugs. [🔗](#)

If you want to prepare for your transition, tell me:

- What **Ruby concepts** are you studying right now (e.g., blocks, modules, OOP)?
- Would you like a **roadmap** of which Ruby concepts are most critical for understanding Rails?

I can map out exactly what you need to focus on next.
